

## Functional Description

The 74VCX32244 contains thirty－two non－inverting buffers with 3－STATE outputs．The device is nibble（ 4 bits）con－ trolled with each nibble functioning identically，but indepen－ dent of each other．The control pins may be shorted together to obtain full 32 －bit operation．The 3－STATE out－
puts are controlled by an Output Enable $\left(\overline{\mathrm{OE}}_{\mathrm{n}}\right)$ input．When $\overline{\mathrm{OE}}_{\mathrm{n}}$ is LOW，the outputs are in the 2 －state mode．When $\overline{\mathrm{OE}}_{\mathrm{n}}$ is HIGH，the standard outputs are in the high imped－ ance mode but this does not interfere with entering new data into the inputs．

## Logic Diagrams

Note 4: The Absolute Maximum Ratings are those values beyond which the safety of the device cannot be guaranteed. The device should not be operated at these limits. The parametric values defined in the Electrical Characteristics tables are not guaranteed at the Absolute Maximum Ratings. The "Recommended Operating Conditions" table will define the conditions for actual device operation.
Note 5: $\mathrm{I}_{\mathrm{O}}$ Absolute Maximum Rating must be observed.
